Clinical Pathways in Emergency Medicine - Suresh S David - 2016-05-23

This book aims to provide condensed and crystallised knowledge, providing the rationale for investigations and interventions. Emergency medicine is a specialty where time and knowledge are critical factors in deciding appropriate management which could otherwise result in loss of life or limb. The challenge often is to have lucid management plans, whilst standing at the bedside of the patient. In order to address this challenge, a manuscript is needed which aims to enhance the clinical skills of the emergency physician. The objective of this book is to compile a road map for practitioners of emergency medicine, which would guide them through algorithm-based pathways. This format is distinctive by nature for its concise presentation, which facilitates easy reading and early application. Written by global experts, this book aims to be a truly international representation of emergency physicians who have come together to deliver contemporary concepts in emergency patient care.

This book provides up-to-date evidence on laparoscopic emergency surgery and supplies concrete advice on when and how to approach patients laparoscopically in an emergency setting. All the diseases eligible for emergency laparoscopy are addressed, and for each disease recommendations, levels of evidence, and technical key points are discussed and analyzed. Diagnostic flow charts are included for cases in which laparoscopy turns out to be the final diagnostic step and the first therapeutic one. Furthermore, problematic and positive aspects of the laparoscopic approach from the anesthesiologic point of view are fully explored. Finally, a useful overview of current practice in hospitals across the world is provided, highlighting the varying applications in relation to different medical “cultures”, skills, resources, and healthcare systems.

Most abdominal symptoms in children can be treated by the general practitioner. The most common one is “dolor abdominis NUD” that has no known aetiology but apparently is a disease in its own. It is important to identify diseases requiring surgical treatment. Acute appendicitis is by far the most common cause of abdominal pain requiring urgent treatment. The cause of abdominal pain may also be located outside the abdominal region, e.g. in respiratory infections. Of non-surgical diseases, urgent treatment is indicated in severe bacterial infections (pyelonephritis, meningitis).
